CSC 495 Assignment #1

Professor Ghazaleh

The project that our group will be creating is going to be a 2-dimensional dungeon crawler made in Godot with an additional city-building phase that will take place after each run of the dungeon. The name that we currently have in mind for our project is “Darkstew Hollow”, and it is going to take place in the once-prosperous village called Ironhaven, a mining settlement nestled in the greater region of Darkstew Hollow that took a turn for the worse. The mines below the town are what brought Darkstew Hollow fortune with the bountiful resources uncovered by the miners. However, the mines are also what brought Darkstew Hollow to its knees when mining too deep uncovered an ancient evil. This ancient evil reduced the town to the derelict place that it currently is, and unleashed hordes of wicked minions that now reside in the mines. The player must venture down through the mines, starting with nothing but a simple weapon, defeating goblins and ghouls along the way in order to collect resources. The resources collected by defeating lackeys of the ancient evil will be used to reconstruct key buildings throughout Darkstew Hollow, such as the blacksmith, armorer’s stand, and the alchemist’s apothecary, with each building unlocking certain items or upgrades that will make defeating the wicked goons easier. Upgrades don’t come for free though, and each will require a certain number of resources to acquire, requiring the player to wisely spend whatever supplies are gathered. The final goal of the player will be to defeat the ancient evil that the villagers uncovered, ultimately bringing peace and fortune back to the settlement of Ironhaven. We are thinking of creating 10 unique levels within the mines for the player to traverse, with a variety of enemies, ranging from goblins equipped with wooden planks to golems made of stone, with potential variations of certain enemies that would drop different materials than their mainline counterparts.
